AMENDMENTS TO THE CLAIMS

 (Currently Amended) A method for preserving confidentiality of an electronic mail from a sender to a recipient, comprising:

authenticating identity information of the recipient;

restricting the recipient's ability to modify contents of the electronic mail based on a confidentiality level established by the sender, irrespective of the recipient's email address;

encrypting the electronic mail, at the recipient, with the authenticated identity information if the recipient attempts to store the electronic mail to a local storage; and

decrypting the electronic mail, at the recipient if the recipient attempts to retrieve the electronic mail from the local storage.

- 2. (Original) The method according to claim 1, wherein the identity information is a system password.
- 3. (Original) The method according to claim 1, the method further comprising: prompting a user of the recipient to supply the identity information; decrypting the electronic mail with the identity information supplied by the user.
- 4. (Original) The method according to claim 1, the method further comprising:
 asserting a control signal to disable options that are originally supported by the recipient if the confidentiality level satisfies a predefined confidentiality threshold.

- (currently amended) The method according to claim 4, wherein the control signal is a confidentiality-level-dependent control signal.
- 6. (Currently Amended) An electronic mail confidentiality preserver of a recipient email client, comprising:
 - an input-processing engine to limit abilities of a user of the recipient email client to modify contents of an electronic mail received by the recipient email client based on a confidentiality level, <u>irrespective of the recipient's email address</u>; and
 - an encryption/decryption engine, coupled to the input-processing engine, to encrypt the electronic mail with authenticated identity information only if the recipient attempts to store the electronic mail to a local storage.
- 7. (Original) The electronic mail confidentiality preserver according to claim 6, the inputprocessing engine further asserts a first control signal to disable options that are originally supported by the recipient email client if the confidentiality level satisfies a predefined confidentiality threshold.
- 8. (Previously Presented) The electronic mail confidentiality preserver according to claim 7, wherein the first control signal is a control signal.
- 9. (Original) The electronic mail confidentiality preserver according to claim 6, the inputprocessing engine further asserts a second control signal to invoke the encryption/decryption engine in response to the user's access.

10. (Original) The electronic mail confidentiality preserver according to claim 6, the encryption/decryption engine further

prompts the user for identity information;

if the user's access to the local storage is to store the electronic mail, encrypts the electronic mail with the identity information; and

if the user's access to the local storage is to retrieve the electronic mail, decrypts the electronic mail with the identity information.

11. (Currently Amended) A electronic mail client, comprising:

a user interface;

a communication engine;

a local storage;

and an electronic mail confidentiality preserver, coupled to the user interface, coupled to the communication engine and coupled to the local storage, wherein the electronic mail confidentiality preserver further comprises:

an input-processing engine to limit abilities of a user of the recipient email client to modify contents of an electronic mail received by the recipient email client based on a user-selected confidentiality level, irrespective of the recipient's email address; and

an encryption/decryption engine, coupled to the input-processing engine, to encrypt the electronic mail with authenticated identity information if the recipient attempts to store the electronic mail to a local storage.

- 12. (Original) The electronic mail client according to claim 11, wherein the user interface further comprises:
 - a first set of confidentiality levels for the user to select from; and
 - a second set of options to manipulate the electronic mail for the user to select from.
- 13. (Original) The electronic mail client according to claim 12, wherein the electronic mail confidentiality preserver further asserts a first control signal to the user interface to disable selected options from the second set of options if the confidentiality level satisfies a predefined confidentiality threshold.
- 14. (Previously Presented) The electronic mail client according to claim 13, wherein the first control signal is a control signal.
- 15. (Original) The electronic mail client according to claim 12, the input-processing engine further asserts a second control signal to invoke the encryption/decryption engine in response to the user's access.
- 16. (Original) The electronic mail client according to claim 12, the encryption/decryption engine further

prompts the user for identity information;

- if the user's access to the local storage is to store the electronic mail, encrypts the electronic mail with the identity information; and
- if the user's access to the local storage is to retrieve the electronic mail, decrypts the electronic mail with the identity information.

17. (Currently Amended) A <u>storage device</u> machine readable medium including a plurality of instructions readable therefrom, the instructions, when executed by a computer system, cause the computer system to perform operations comprising:

authenticating identity information of a recipient of an electronic mail;

restricting the recipient's ability to modify contents of the electronic mail based on a confidentiality level established by a sender of the electronic mail, <u>irrespective</u> of the recipient's email address;

encrypting the electronic mail with the authenticated identity information if the recipient attempts to store the electronic mail to a local storage; and decrypting the electronic mail if the recipient attempts to retrieve the electronic mail from the local storage.

- 18. (Original) The machine readable medium according to claim 17, wherein the identity information is a system password.
- 19. (Original) The machine readable medium according to claim 17, the instructions further comprising:

prompting a user of the recipient to supply the identity information; decrypting the electronic mail with the identity information supplied by the user.

20. (Original) The machine readable medium according to claim 17, the instructions further comprising:

asserting a control signal to disable options that are originally supported by the recipient if the confidentiality level satisfies a predefined confidentiality threshold.

21. (Previously Presented) The machine readable medium according to claim 20, wherein the control signal is a control signal.
